Application/Control Number: 09/801,025

' Art Unit: 2815

The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless -

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.

Claims 1-11 are rejected under 35 U.S.C. 102(b) as anticipated by or, in the alternative, under 35 U.S.C. 103(a) as obvious over Jp '854.

Jp '854 shows in figure 4 metal lines connected to polysilicon gate lines 12,13 outside the element region and inside the element region at 21. Claims 1,2, and 3 are anticipated. Claim 4 is considered obvious because omitting connections is considered an obvious design choice. Jp '854 shows one or two connections inside the element isolation region. Omitting all the connections in the element region is merely repeating the prior art of having no interior connections. Claims 5-10,12 are likewise considered obvious or anticipated as the transistors of '854 show one or two interior connections.

Claims 1-10,12-21, are rejected under 35 U.S.C. 103(a) as being unpatentable over Jp' 854 in view of '516.

Jp '854 as applied above. The additional limitations regarding an additional insulation layer is not patentable as Jp '516 shows a metal layer M2 connected to an underlying polysilicon gate electrode through an additional insulation layer. Clearly it

would have been obvious from the suggestions of both Jp references to have practiced a resistance reducing metal layer over the poly gate electrode in both the element region and isolation region. In the element region there would exist the gate insulation layer. Jp '516 shows and suggests the metal layer overlying the poly gate layer by an additional insulation layer. See figure 3 of '516. Claims reciting silicide source and drain contacts are obvious short channel device designs and do not add patentable limitations. Claims 13-21 are obvious structure.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Jerome Jackson Jr. whose telephone number is 703 308 4937. The examiner can normally be reached on t-th 9-5.

The fax phone number for the organization where this application or proceeding is assigned is (703) 872-9306.

Any inquiry of a general nature or relating to the status of this application or proceeding should be directed to the receptionist whose telephone number is 703 308 0956.
